Introduction

CSR (Corporate Social Responsibility) is an important part of communication with stakeholders and a response to the need for non-financial reports. Regrettably, the rules of non-financial reporting are not regulated – except by Directive 2014/95/EU, which will apply to large enterprises of public interest, and which must be introduced by the member states by 6 December 2016. CSR reports are drafted using a variety of principles and guidelines, which limits comparisons across enterprises, transparency and the assessment of progress made on the realisation of CSR goals.

Communication of an organisation’s performance in its economic, social and environmental dimensions to the parties concerned is the principal function of the CSR reporting process. In this way, an enterprise demonstrates effectiveness of its actions in the area of social responsibility management. Thus, CSR reporting should be part of the process of creating an organisation’s strategy, implementation of its action plans and evaluation of results, as well as a tool for improvement of a CSR management system, involving stakeholders and obtaining their contributions to functioning of an organisation (GRI Second G4 Public Comment).

CSR reporting is an integral part of the concept of corporate social responsibility, according to which business is an economic institution responsible for both providing social services and generation of profits (Berle, 1931; Dodd, 1932). The European Commission defines CSR as responsibility of enterprises for their impact on society (Green Paper, 2011). According to Carroll (1979), responsibility of enterprises encompasses four key areas: economic, legal, ethical and philanthropic, all of which should be integrated into strategic management. They allow an enterprise to reach an equilibrium of three dimensions of its activities: economic, social and environmental (Triple-Bottom-Line – Three P’s Balance: Planet, Profit, People). ISO 26000 states integrating assumptions of the corporate social responsibility into a management system is an effective way of implementing the concept. According to Sopkova and Raškovska (2012), at present, the concept of social responsibility is an important part of corporate strategies. Horehajova and Marasova (2008) have identified three main expressions of the CSR:

- hierarchical – represents the conception of the CSR with the leading role of managers,
- participative – represents a more balanced form of the CSR which is based not only on managers but also on employees or their representatives,
- minimalist – consists of compulsory CSR imposed by the state and voluntary CSR that appears as a limited commitment of a company.

The scope and quality of information and reporting disclosures play an important part in building socio-economic relations of an enterprise and its environment and are addressed by systemic theories, referred to as open system theories (Deegan & Unerman, 2011). They help to explain causes of extended information disclosures by enterprises that go beyond financial reports to additionally include environmental and social issues. The concept of corporate social responsibility is based on the theory of stakeholders, which assumes an enterprise is linked to a variety of groups that affect its activities and in turn are under its impact (Freeman, 1984). In the classic version, this objective was referred to maximisation of total benefits, mainly to shareholders, from capitals committed to an enterprise. At present, it is seen in a broader perspective and applied to other stakeholder groups as well, which means value optimisation for stakeholders, i.e.
achievement of sustainable value, becomes the enterprise’s objective – benefits to shareholders do not detract from benefits accruing to other stakeholders. Due to varying scopes of benefits to stakeholders, their differing perception and extents of knowledge, it appears reasonable to enhance information openness of enterprises, that is, to standardise principles of reporting, which would be bound to help limit the information asymmetry between diverse groups of stakeholders.

Therefore, the subject appears topical and requires a solution by indicating principles of reporting prevailing with socially responsible entities and by verifying reasons for which enterprises select certain reporting standards.

The aims of this paper are to examine the reasons for reporting non-financial information cited in the specialist literature and by enterprises preparing CSR reports, and to determine the benefits of standardising reports on non-financial information.

The following hypotheses are tested:

1. Communication with stakeholders is the fundamental reason for compiling reports on non-financial information (H1). This will be verified by analysing the literature, and the results of a survey of enterprises implementing CSR ideas.

2. The need to standardise CSR reporting, to ensure its transparency and clarity, is noted by reporting organisations (H2). This will be verified by analysing the principles of reporting by socially responsible entities in 2010–2014, by regions of the world and by company size, evaluated jointly or separately.

The rest of the paper is organised as follows. Section 1 reviews the recent theoretical and empirical literature on CSR reporting and outlines some of its general themes. Section 2 presents the surveyed reasons for CSR reporting in enterprises. Section 3 contains the arguments for standardization of non-financial information. Section 4 examines trends in CSR reporting, evaluates extent of its standardization and concludes.

1. Benefits of Corporate Social Responsibility (CSR) Reporting – Review of the Literature

CSR reporting, part of CSR strategy, provides for the evaluation and monitoring of progress made on objectives and supports the implementation of action strategies via the commitment of employees and other stakeholders. Thus, it assures effective action, raises awareness of CSR issues and improves the image of an enterprise. It is above all an opportunity for the presentation of an enterprise and for communication with stakeholders.

These arguments are the chief causes of CSR reporting and the subjects of research. Emphasis on the benefits of CSR reporting prevails in the relevant literature. Some claim, however, that CSR reporting is unnecessary and fails to positively affect business and the image of enterprises (Maignam, 2001; Jones, Pelsmacker, Driessen, & Rayp, 2005; Comfort & Hillier, 2006). The literature on the causes and benefits of CSR reporting distinguishes the following reasons for reporting:

- meet requirements of stakeholders – a form of communication with stakeholders,
- improve image and reputation of enterprises,
- enhance brand value,
- be a major element of strategic management that helps achieve objectives and realise corporate strategy,
- increase profits and minimise risk,
- provide for comparative analysis of CSR.

According to Juscius, Sneideriene and Griauslyte (2014), there are two main reasons that drive the growing scale of CSR reporting:

1. Stakeholder pressure for reporting on CSR activities:
   - Government pressure,
   - NGO pressure,
   - Recommendations of financial organizations,
   - Investor pressure.

2. The benefits for business of reporting on CSR activities:
   - Reduce the risk of sanctions,
   - Increase productivity and profitability,
   - Open up communication channels (reputation, recruitment of talented employees, consumer loyalty, public support, easier access to capital).

A detailed analysis of reasons for CSR reporting is tabulated below.

The review of the literature on the benefits of CSR reporting shows that the information requirements of stakeholders were primarily indicated as the main reason for the reporting, at the initial development stages of the process of disclosing non-financial information. In time,

improved image and reputation, creation of brand value, as well as increasing profitability and minimising risks began to be cited. CSR became a major source of information for broadly-defined stakeholders, was used to manage enterprises and to generate benefits, including improved financial performance. These results were confirmed by the research of Margolis et al. (2007) that pointed to a link between environmental reporting and goodwill; research by Dimson et al. (2012), who recorded growth in the share prices of large enterprises; by Plumlee et al. (2010) who demonstrated improved cash flows; and by Lang et al. (2012), who traced a link between CSR and financial liquidity. The need to standardise CSR reporting...
in order to assure its comparability also began to be highlighted.

2. Reasons for CSR Reporting in the Opinions of Enterprises

The benefits of reporting non-financial information can be divided into two groups:

- **Internal** – reporting helps to streamline a range of processes in an enterprise by diagnosing problems. It also helps to maintain appropriate relations between market positioning of a product brand and its production, which influences the assessment of products and thus demand, market share and the profits of enterprises.

- **External** – reporting is a part of information policies that: reinforces the reliability of actions for and relations with stakeholders, helps to manage reputation risks and build competitive advantage.

These benefits are reflected in a survey by *EY and Boston College Center for Corporate Citizenship* (2013) with members of the Center for Corporate Citizenship and Survey Sampling International (SSI). There were 579 respondents in total – 391 of whom work for organizations that issue a sustainability report, and 188 for organizations do not issue reports.

An analysis of the reasons for preparing CSR reports demonstrates:

- Transparency with stakeholders is the principal reason, selected by all the entities examined, proof that the reporting is an important element of information policies and reporting itself is seen as part of the information.

- The organisations surveyed perceive reporting as a major part of risk management, which contributes to more efficient operations (an internal benefit), to building of reliability with stakeholders and to competitive advantage (external benefits).

- CSR reporting is not currently considered to be a marketing tool that would build brand (amongst large enterprises – 4% of the organisations questioned disagreed, that rose to 5% in in finance and insurance). This reason should be expected to become more important over time.

- Some entities are not convinced it is reasonable to draft CSR reports (4% of large and 6% of smaller entities, 7% of public and 8% of private organisations). This means an

Source: The authors’ own compilation on the basis of EY (2013).
absence of obligatory reporting undermines its rationale; in addition, organisations employ other forms of communication with stakeholders and find them adequate.

It is also interesting to analyse the reasons for not compiling CSR reports by 30% of the organisations examined (Tab. 3).

The survey shows that 51% of public and 18% of private organisations which do not report indicated absence of resources on which to base reports – which unequivocally points to a clear need to define rules of preparation, or reporting standards. 45% of private and 26% of public entities that do not report indicated a lack of stakeholder requirements as a reason – proof that the idea of CSR and the significance of the associated information policies are misunderstood. These organisations do not realise the potential benefits they could attain by compiling CSR reports.

In general, the introduction of compulsory CSR reporting and the definition of its standards would contribute to the development of the idea of CSR and improve the information policies of enterprises by ensuring their comparability and legitimacy.

### 3. Standardisation of Non-Financial Information

The fundamental reason for standardising non-financial information reporting is to improve the transparency of social and environmental information supplied by reporting organisations, in order to assure its comparability both across sectors and internationally. Non-financial information disclosed assists enterprises with measurement, supervision and management with reference to financial performance and its impact on the public, and to help to satisfy the needs of investors and other interested parties, including consumers, as far as access to information about public impact of an enterprise is concerned. It is therefore valuable both to enterprises themselves and to a wide range of external and internal stakeholders. Legal systems laying down guidelines for CSR reporting vary considerably, however, which impedes comparability across enterprises and prevents assessments of their actions and the CSR principles adopted. It would therefore be desirable to develop international rules of CSR reporting, including the format and scope of reporting, which would provide for a transparent message of CSR-related activities.

Two models of CSR reporting can be distinguished:

- voluntary, supported mainly by corporations (Rodriquez & LeMaster, 2007; Francis, Nanda, & Olsson, 2008; Dhaliwal, Li, Tsang, & Yang, 2009),
- compulsory, mainly promoted by non-government organisations, pressure groups and trade unions (Doane, 2002; Maguire, 2011; Ioannou & Serafeim, 2011).

Specialist literature offers arguments both for and against these models of CSR reporting. Proponents of compulsory reporting usually point to fostering of socially responsible management practices (Ioannou & Serafeim, 2011; Porter & Kramer, 2011) and transparency of the reports (Elkington & Spencer-Cooke, 1997; Gray, 2007; Doane, 2008; DeSilva, 2008; Lydenberg, Rogers, & Wood, 2010; Gray & Bebbington, 2010).

Opponents of compulsory reporting most frequently stress costs of the reporting, associated both with compilation of a report in itself and with monitoring of the reporting

process (Schaltegger, 1997; CGA, 2011; Centre for Strategy and Evaluation Services, 2011) as well as utility of the reports – fulfilment of only minimum regulatory requirements contributes to neglecting the process of gathering and analysing CSR data, which leads to the undesirable outcome of low-quality information displacing high-quality information (Schaltegger, 1997; Herzig & Schaltegger, 2006). Obviously, each of the models has its advantages and disadvantages (Tab. 4).

Analysis of global trends in CSR reporting shows about two thirds of 140 national standards, both compulsory and voluntary, identified in 30 countries are compulsory (KPMG, UNEP, GRI, University of Stellenbosch, 2010). The need to standardise principles and, at least partly (e.g. by industry), formats of CSR reporting is clear, therefore, as it would preserve flexibility and individuality of enterprises. It is difficult to subscribe to views of Herzig and Schaltegger (2006), however, that fulfilment of barely minimum regulatory requirements contributes to neglecting the process of gathering and analysing CSR data and leads to low quality of information. Introduction of compulsory reporting of non-financial information and its appropriate standardisation will contribute to improved quality of the information as it will provide for a standard presentation and comparability of data. It will not necessarily mean, as indicated by Herzig and Schaltegger (2006), neglecting the process of gathering and analysing CSR data. Conversely, maintenance of data transparency and legibility prevents all data from being presented in external reports since too much information is as inadequate as its absence.

The practice of enterprises publicising their CSR initiatives shows this information is communicated via: mass media, financial reports including incomplete and random CSR information, social or integrated reporting. These are very different practices, a result of the lack of any standard regulations of CSR reporting globally, continentally or nationally. Enterprises compile CSR reports according to a variety of guidelines, e.g. the Global Reporting Initiative (GRI), ISO 26000, Global Compact, and the Carbon Disclosure Project. Reporting in line with the GRI standards is the most common (Lament, 2015; Marková, Lament, & Wolak-Tuzimek, 2015).

Research into corporate social responsibility by the European Commission (2013) points to two major problems:
▪ Insufficient transparency of non-financial information, due both to market imperfections and regulatory gaps, the
latter caused by an absence of appropriate legal regulations,
- Lack of diverse membership of management boards, a result of inappropriate recruitment practices for management bodies – recruitment of candidates with similar profiles. This contributes to ineffective control and supervision of management decisions, due to uniform viewpoints, value systems and competences, and restricts corporate innovation.

To address these issues, the European Commission has passed Directive 2014/95/EU, to be introduced by the member states by 6 December 2016 and applicable to the relevant businesses during the financial year beginning on 1st January 2017 or during the calendar year 2017.

Directive 2014/95/EU applies to large enterprises of public interest, i.e. quoted companies, insurance companies, banks and other organisations of public importance in view of their business profile and employing more than 500 staff on average in a financial year as at the balance closing date.

Pursuant to Art. 1 section 1 item 1 of EU Directive, the organisations concerned shall include in their reports non-financial information, including information required to understand the development, results and position of the organisation and the impact of its operations in respect of environmental and social issues, respect for human rights, counteracting bribery and corruption, including:
- A brief description of the business model.
- A description of practices with regard to such issues, including due diligence processes in place.
- The outcomes of these practices.
- The chief risks associated with these issues and with the operations of the organisation.
- The key non-financial performance indicators relating to a given business.

Notably, reporting organisations:
- Must, as a minimum, provide explanations if they do not follow any policies in respect of the foregoing issues.
- By way of exception, may omit information about expected occurrences or matters subject to negotiations in progress if their disclosure might have a seriously adverse effect on commercial position of an organisation while having no impact on a correct and objective understanding of the development, performance and position of the organisation and the impacts of its activities.
- Can rely on national, EU or international framework principles. These should be specified in the circumstances.
- May be free from the duty to report non-financial information if they prepare a separate report which is published together with financial statements, or on the organisation’s website, within six months of the balance closing date, and if financial statements contain a reference to such a report.

The regulations of the Directive are a step forward since they will help to standardise the rules of reporting non-financial information, and will improve its transparency and utility. They will largely apply to organisations that already compile such reports in the spirit of CSR, and a lack of detailed regulations would impede their comparability, since organisations could rely on different rules and guidelines. Thus, the Directive 2014/95/EU fills a regulatory gap and improves the usefulness of the information generated by organisations obliged to prepare CSR reports.

Enterprises submitting CSR reports to GRI (Global Reporting Initiative) in 2010–2014 were surveyed in order to determine trends in CSR reporting and to evaluate the extent of its standardisation. The numbers and structure of the reports were analysed by region and by enterprise size. The criteria were considered jointly and separately, that is, rules of CSR reporting across global regions were examined by size of enterprise.

Notably, reporting organisations:
- Must, as a minimum, provide explanations if they do not follow any policies in respect of the foregoing issues.
- By way of exception, may omit information about expected occurrences or matters subject to negotiations in progress if their disclosure might have a seriously adverse effect on commercial position of an organisation while having no impact on a correct and objective understanding of the development, performance and position of the organisation and the impacts of its activities.
- Can rely on national, EU or international framework principles. These should be specified in the circumstances.
- May be free from the duty to report non-financial information if they prepare a separate report which is published together with financial statements, or on the organisation’s website, within six months of the balance closing date, and if financial statements contain a reference to such a report.

The regulations of the Directive are a step forward since they will help to standardise the rules of reporting non-financial information, and will improve its transparency and utility. They will largely apply to organisations that already compile such reports in the spirit of CSR, and a lack of detailed regulations would impede their comparability, since organisations could rely on different rules and guidelines. Thus, the Directive 2014/95/EU fills a regulatory gap and improves the usefulness of the information generated by organisations obliged to prepare CSR reports.

Enterprises submitting CSR reports to GRI (Global Reporting Initiative) in 2010–2014 were surveyed in order to determine trends in CSR reporting and to evaluate the extent of its standardisation. The numbers and structure of the reports were analysed by region and by enterprise size. The criteria were considered jointly and separately, that is, rules of CSR reporting across global regions were examined by size of enterprise.

The figures concerning CSR reports are divided into reports following the GRI guidelines and those based on other rules and guidelines. Principles of classifying organisations according to GRI assumptions are presented in Tab. 5.

The research implies:
1. CSR reports commonly follow the GRI guidelines (93.5% organisations questioned in 2010, 79% in 2012, and 77.1% in 2014). A declining trend is observed, though, which suggests other reporting guidelines have been gaining popularity (2010 – 6.5%, 2012 – 21%, 2014 – 22.9%) – Fig. 1.

Fig. 2: Structure of reports submitted to GRI across regions in 2010 (%)

Source: The authors’ own research on the basis of GRI, Sustainability Disclosure Database
2. A majority of CSR reports are compiled by enterprises in Europe (2010 – 42.6% of the organisations examined, 2012 – 38%, 2014 – 34.9%). A declining trend can be observed, though, which means CSR reporting is expanding intensely in other regions, mainly in Asia (2014 – 25.6% of the organisations surveyed, 2012 – 23.1%, 2010 – 21.8%) and Africa (2010 – 4%, 2012 – 8.9%, 2014 – 7.2%). Increasing numbers of reports are drafted in the remaining regions, yet the growth is not sufficient to affect the structure of the reporting (Latin America – approximately 13% of the reports in the entire period under analysis, North America – 13–14% depending on the year, Oceania – 3–5% depending on the year) – Figs. 2–4.

3. The reports are most frequently compiled by large enterprises, accounting for 68.6% in 2010, 64.9% in 2012, and 64% in 2014. Their share in the structure of reporting has been diminishing, proof that the reporting is gaining importance with other organisations, chiefly MNEs (in 2010 – 20% of the organisations questioned, 2012 – 23.8%, and 2014 – 25.2%). Numbers of reports submitted by SMEs are not sufficiently large to affect the structure of reporting. Their share reached: 11.4% in 2010, 11.3% in 2012 and 10.8% in 2014 – Tab. 6.

4. Large enterprises preparing CSR reports operate mainly in Europe (2010 – 42.7%, 2012 – 35.3%, 2014 – 35%) and Asia (2010 – 21.5%, 2012 – 24.9%, 2014 – 27.4%). The proportion of reporting enterprises has been climbing in Asia and falling in Europe – Fig. 5.

5. SMEs reporting under CSR, like large enterprises, chiefly operate in Europe (2010 – 60.6% of SMEs examined, 2012 – 55.6%, 2014 – 52.6%) – Fig. 6.

6. MNEs enterprises preparing CSR reports operate mainly in Europe (2010 – 32.4%, 2012 – 33.7%, 2014 – 34.9%) and Asia (2010 – 30%, 2012 – 34%, 2014 – 26.5%). The proportion of reporting enterprises has been climbing in Europe and falling in Asia – Fig. 7.

7. Both large enterprises, SMEs and MNEs draft their reports not only in compliance with the GRI guidelines, as the incidence of reporting based on other guidelines has been growing substantially:

Large enterprises (2010 – 7%, 2012 – 20.6%, 2014 – 21%).

MNE (2010 – 6.4%, 2012 – 23.5%, 2014 – 29.9%) – Fig. 8.

This tendency is reaffirmed by an analysis of the enterprises in those regions with the most distinct growth:

- SME – in North American enterprises (2010 – 0.4%, 2014 – 5.4% of SMEs reviewed).
- Large enterprises – in European enterprises (2010 – 2.7%, 2014 – 7.4% of the large enterprises examined).
- MNE – in European enterprises (2010 – 2%, 2014 – 9.7% of MNEs surveyed).

Conclusion
Presentation of non-financial information helps to identify issues important to a given entity and the associated risks. This is additional information, not clearly visible in financial reports since, in accordance with the principle of significance, only events with significant impact on operations and financial standing of an enterprise should be disclosed. If an entity fails to recognise environmental and social developments as significant to its financial position and its activities, they will not be presented in financial statements either. Therefore, absence of publication duties concerning non-financial information should be regarded as contributing to emergence of the information asymmetry.

It should be pointed out not only reporting in itself but also its scope and principles are important to stakeholders, including investors. In order to limit the information asymmetry, non-financial data should be presented:
- to an adequate extent – it is important to determine types of information to be disclosed. Both information gaps and excess information are inadvisable, both producing similar effects. Information to be disclosed should be specified, therefore,
- in an appropriate form – to assure comparability and transparency of the disclosures,
- according to standards defined e.g. for specific industries.

Non-financial information must be said to constitute an important part of the decision-making process in an enterprise, therefore, lack of a duty to report it contributes to emergence of the information asymmetry, since various entities hold information of different quality. In order to limit the information asymmetry, the duty of reporting non-financial information should be introduced and standards of non-financial reporting must be laid down.

The literature review and empirical research into motivations for CSR reporting and trends in reporting of non-financial information have helped to verify the hypotheses formulated initially:
1. Communication with stakeholders is the fundamental reason for reporting non-financial information. This is confirmed by the literature review, with most authors believing this is the prime reason for preparing CSR reports. Authors indicating other motivations treat it as the fundamental cause which obtains jointly with other motivations.
   This is also supported with results of the survey among enterprises compiling CSR reports – all the enterprise groups queried commonly point to this reason for CSR reporting.
2. The need to standardise CSR reporting to ensure its transparency and clarity is noted by reporting organisations. This is proven by surveys of organisations drafting CSR reports – approximately 80% of all reports follow the GRI guidelines, which thus become the most popular rules of reporting. This means the reporting enterprises wish their reports to be clear, transparent and comparable and for their stakeholders to be able to fully satisfy their information requirements. This is also evidence of the care for good relations with stakeholders, who receive standardised data although this is not binding on enterprises. A growing tendency for CSR reporting to follow guidelines other than the GRI can also be noted in the entire period under analysis – another argument for specifying rules of reporting and introducing standards. This will not necessarily be a single compulsory standard, yet a model report would need to be set to assure transparency and comparability.
   This is addressed by Directive 2014/95/EU, applicable only to large enterprises employing more than 500 staff, nonetheless it fills a regulatory gap, will contribute to improved comparability of results and will improve utility of information generated by enterprises drafting CSR reports.
   It would be reasonable to continue the research by reviewing norms and standards of CSR reporting by enterprises active in particular industries, as this would help to define their characteristic norms and standards that could subsequently be standardised.

Abstract

THE REPORTING OF NON-FINANCIAL INFORMATION AND THE RATIONALE FOR ITS STANDARDISATION

Peter Krištofík, Marzanna Lament, Hussam Musa

CSR (Corporate Social Responsibility) is an important part of communication with stakeholders and a response to the need for non-financial reports. Regrettably, the rules of non-financial reporting are almost not regulated. CSR reports are drafted using a variety of principles and guidelines, which limits comparisons across enterprises, transparency and assessment of progress.

The reasons for reporting non-financial information cited in the specialist literature, and by enterprises preparing CSR reports are examined, and the benefits of standardising reports of non-financial information are determined.

The literature review and empirical research into the motivations for CSR reporting and the trends in reporting of non-financial information helped to verify the initial hypotheses:

1. Communication with stakeholders is the fundamental reason for reporting non-financial information. This is confirmed by the literature review, with most authors believing this is the prime reason for preparing CSR reports. Authors indicating other motivations still treat it as the fundamental cause which exists jointly with other motivations.

2. The need to standardise CSR reporting to ensure its transparency and clarity is noted by reporting organisations. This is proven by surveys of organisations drafting CSR reports – approximately 80% of all reports follow the GRI guidelines. This means the reporting enterprises wish their reports to be clear, transparent and comparable and for their stakeholders to be able to fully satisfy their information requirements. This is also evidence of the care for good relations with stakeholders, who receive standardised data although this is not binding on enterprises. A growing tendency for CSR reporting to follow guidelines other than the GRI can be noted in the entire period under analysis. This will not necessarily be a single compulsory standard, yet a model report would need to be followed to assure transparency and comparability.

The Regulations of the Directive 2014/95/EU are a step forward since they will help to standardise rules of reporting non-financial information and will improve its transparency and utility.

Key Words: Corporate Social Responsibility, reporting, management.
